Real business & application

Marketing, production, banking, education, entertainment, medical, ... → complex, richness

Automate & support tasks

develop

How can computers understand the real world domain to digitize & support automation?

Real business & application

Marketing, production, banking, education, entertainment, medical, ... → complex, richness

How can computers understand the real world domain to digitize & support automation?

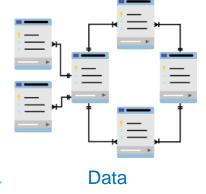

☐ How?

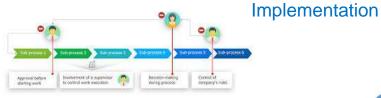

Business environment

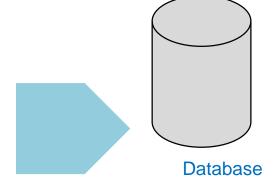

Processes, business rules, interface

Analyze & design

Application

1

□ どうやって?

Business environment

Analyze & design

Processes, business rules, interface

- Examples of information in organisations
 - Banking and finance
 - Customer information, accounts, loans, banking transactions
 - Customer information: name, address, email, identity number,
 - Information of sales and purchases
 - Education
 - Student information, course registrations and grades
 - Airline
 - Reservations, information of flights and ticket prices
 - Human resources
 - Information about employees, salaries, payroll, PIT (taxes), rewards, talents

導入

□組織の情報の例

and銀行と金融

顧客情報、アカウント、ローン、銀行取引

顧客情報:名前、住所、電子メール、身元番号、…

販売と購入の情報

and教育

学生情報、コース登録、成績

and航空会社

予約、フライトの情報、チケット価格

an从事

従業員、給与、給与、ピット(税金)、報酬、才能に関する情報

What is data? Facts that can be recorded and have meaning Pieces of data are individual pieces of information Data is a collection of facts, such as numbers, words, measurements, observations or even just descriptions of things represented in a form suitable for processing by computer **Example** "Nguyễn Văn A" is a student's name "11.12.008" is a student's ID "19-02-2015" is a Tet day of 2015

What is data? Facts that can be recorded and have meaning Pieces of data are individual pieces of information Data is a collection of facts, such as numbers, words, measurements, observations or even just descriptions of things represented in a form suitable for processing by computer **Example** "Nguyễn Văn A" is a student's name "11.12.008" is a student's ID "19-02-2015" is a Tet day of 2015

- Database (DB)
 - A collection of related data
 - Contains information relevant to a business
- Example:
 - Sale, purchase
 - Payable and receivable accounts
 - Employees
 - Printing of employee's weekly paychecks

- Database (DB)
 - A collection of related data
 - Contains information relevant to a business
- Example:
 - Sale, purchase
 - Payable and receivable accounts
 - Employees
 - Printing of employee's weekly paychecks

- □ Database (DB)
 - Definition:
 - A logically coherent collection of data with some inherent meaning
 - Random assortment of data cannot correctly be a database
 - is designed, built, and populated with data for a specific purpose, for intended group of users or applications
 - Example:
 - □ A list of students → data structure of group of students
 - □ A list of classes → data structure of classes
 - □ DB is stored using a structure → structured database
 - Other types of database: unstructured databases, document databases, graph databases

- □ Database (DB)
 - Definition:
 - A logically coherent collection of data with some inherent meaning
 - Random assortment of data cannot correctly be a database
 - is designed, built, and populated with data for a specific purpose, for intended group of users or applications
 - Example:
 - □ A list of students → data structure of group of students
 - □ A list of classes → data structure of classes
 - □ DB is stored using a structure → structured database
 - Other types of database: unstructured databases, document databases, graph databases

- Database Management System (DBMS)
 - ☐ A **collection of programs** that enables users to build, operate and maintain a database = **software**
 - A general-purpose software system that facilitates
 - Definition specifying the data types, structures, and constraints for the data
 - Construction storing the data itself on some storage medium
 - Manipulation querying the database to retrieve data, updating the database to reflect changes, generating reports from the data
 - Sharing allowing multiple users/programs to access the database concurrently

- Database Management System (DBMS)
 - ☐ A **collection of programs** that enables users to build, operate and maintain a database = **software**
 - A general-purpose software system that facilitates
 - Definition specifying the data types, structures, and constraints for the data
 - Construction storing the data itself on some storage medium
 - Manipulation querying the database to retrieve data, updating the database to reflect changes, generating reports from the data
 - Sharing allowing multiple users/programs to access the database concurrently

Database Management System (DBMS)

Set of programs that enable users to create, operate, and maintain databases

Database Management System (DBMS)

Set of programs that enable users to create, operate, and maintain databases

Example #3

- Company database project management
 - Definition
 - Specify the structure of records, including data elements, data types
 - Construction
 - Store data to represent an employee, project, department... as a record
 - Manipulation
 - Querying: "Select the employees whose department is 5"
 - Updating: "Move the employee Nguyen Thanh Tung to department 1"

Example #3

- Company database project management
 - Definition
 - Specify the structure of records, including data elements, data types
 - Construction
 - Store data to represent an employee, project, department... as a record
 - Manipulation
 - Querying: "Select the employees whose department is 5"
 - Updating: "Move the employee Nguyen Thanh Tung to department 1"

Quiz #1

- What below statements are TRUE?
 - A. DB is a collection of related data
 - B. DB is collection of facts
 - C. DB is stored in a structure called structured database
 - D. "22-01-2023" is a data
- ☐ DBMS is?
 - A. A data set with the same structure
 - B. Discrete data
 - C. Tools supporting data or application programming
 - D. A set of programs to build, operate, and maintain databases

Quiz #1

- What below statements are TRUE?
 - A. DB is a collection of related data
 - B. DB is collection of facts
 - C. DB is stored in a structure called structured database
 - D. "22-01-2023" is a data
- ☐ DBMS is?
 - A. A data set with the same structure
 - B. Discrete data
 - C. Tools supporting data or application programming
 - D. A set of programs to build, operate, and maintain databases

Evolution

☐ File

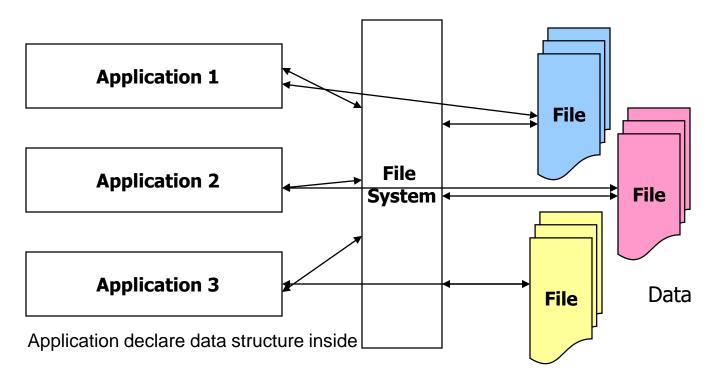

An application program has its own data

Evolution

☐ File

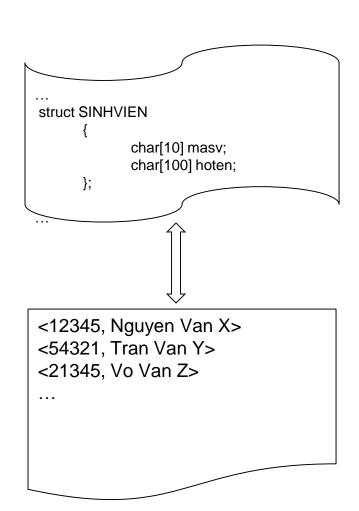

An application program has its own data

Evolution - Example

Program

Data file

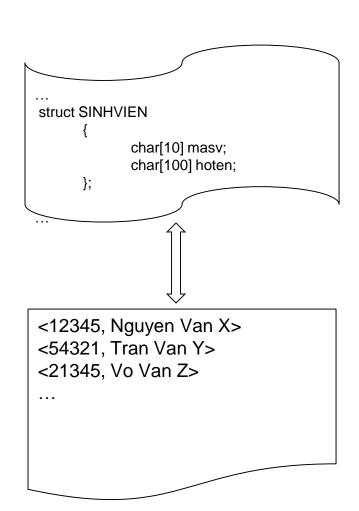

Evolution - Example

Program

Data file

- Limitations
 - Data redundancy
 - Wasted storage space
 - Opportunities of the inconsistency
 - Data sharing is limited
 - Difficult recovery
 - Low security
- But, still be used in some applications
 - Small size
 - Storing and accessing data only, not including other processing operations
 - Fee costs less
 - Operation or maintenance

- Limitations
 - Data redundancy
 - Wasted storage space
 - Opportunities of the inconsistency
 - Data sharing is limited
 - Difficult recovery
 - Low security
- But, still be used in some applications
 - Small size

 - Sharing of data
- Database users
- Architecture of a DBMS
- Properties of DBMS
- Data models
- Database languages

- The DB system contains not only the DB itself, but also a complete definition/description of the DB structure
- The definitions are stored in catalog called "metadata"
 - Contains information such as the structure of data, type and storage format of data items, and constraints on the data
- Many applications can access to the DB
 - Refer to *catalog*, knowing the structure of files in specific DB (type and format of data)

- The DB system contains not only the DB itself, but also a complete definition/description of the DB structure
- The definitions are stored in catalog called "metadata"
 - Contains information such as the structure of data, type and storage format of data items, and constraints on the data
- Many applications can access to the DB
 - Refer to *catalog*, knowing the structure of files in specific DB (type and format of data)

An example of a database catalog/metadata

RELATION

Relation_name	No_of_columns
EMPLOYEE	7
PROJECT	4
WORKS_ON	3

COLUMN

Column_name	Data_type	Belongs_to_relation
LName	Character(10)	EMPLOYEE
FName	Character(10)	EMPLOYEE

An example of a database catalog/metadata

RELATION

Relation_name	No_of_columns
EMPLOYEE	7
PROJECT	4
WORKS_ON	3

COLUMN

Column_name	Data_type	Belongs_to_relation
LName	Character(10)	EMPLOYEE
FName	Character(10)	EMPLOYEE

Isolation

- The structure of data is stored in catalog separately from the access programs
 - Program-Data independence

Catalog/metadata

Data

Program

Program contains catalog → data structure depends on the program

DBMS contains catalog → data is independent of program

- A little change in the data structure
 - Application programs are rarely revised

Isolation

- The structure of data is stored in catalog separately from the access programs
 - Program-Data independence

Catalog/metadata

Data

Program

Program contains catalog → data structure depends on the program

DBMS contains catalog → data is independent of program

- A little change in the data structure
 - Application programs are rarely revised

Data abstraction

- The DB system provides a conceptual representation of the data to hide certain details of how the data are stored and maintained
- Example
 - Data model is a type of data abstraction
 - Objects
 - Properties
 - Relationships
 - ☐ These logical concepts are easier for user to understand than computer storage concepts

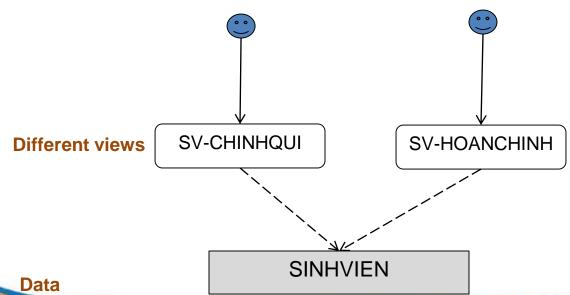

Data abstraction

- The DB system provides a conceptual representation of the data to hide certain details of how the data are stored and maintained
- Example
 - Data model is a type of data abstraction
 - Objects
 - Properties
 - Relationships
 - ☐ These logical concepts are easier for user to understand than computer storage concepts

Views of data

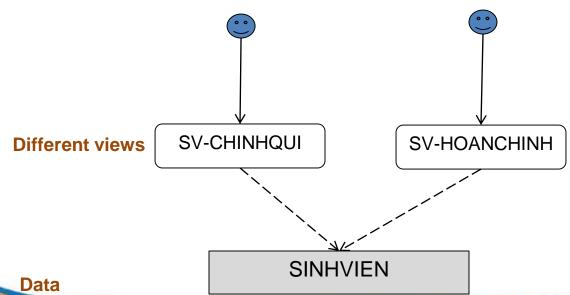

- A DB has many users
- Each user may require a different *perspective or view* of the database
- A view may be
 - A subset of the database
 - Aggregate data that are derived from the database

Views of data

- A DB has many users
- Each user may require a different *perspective or view* of the database
- A view may be
 - A subset of the database
 - Aggregate data that are derived from the database

Sharing of data

- A multiuser DBMS
 - Allows multiple users accessing to DB at the same time
 - □ Data for many applications are integrated and maintained in a single DB
- Using concurrency control mechanisms to access the data reasonably
 - Avoid data contention (tranh chấp)
 - Ensure the data will always be valid when they are accessed

Sharing of data

- A multiuser DBMS
 - Allows multiple users accessing to DB at the same time
 - □ Data for many applications are integrated and maintained in a single DB
- Using concurrency control mechanisms to access the data reasonably
 - Avoid data contention (tranh chấp)
 - Ensure the data will always be valid when they are accessed

Quiz #2

1. Self-Describing is

- A. To aggregate data that are derived from the database
- B. To enable a DB to define in catalog called "metadata"
- C. To enable only one application can access to DB
- D. To define different views of DB

2. What below statements are TRUE?

- A. Sharing data: allows multiple users to access to DB at the same time
- B. A view can mainly store data of DB
- C. Isolation: combining program and catalog/metadata together
- Data abstraction provides a conceptual representation of the data to hide certain details of how the data are stored and maintained

Quiz #2

1. Self-Describing is

- A. To aggregate data that are derived from the database
- B. To enable a DB to define in catalog called "metadata"
- C. To enable only one application can access to DB
- D. To define different views of DB

2. What below statements are TRUE?

- A. Sharing data: allows multiple users to access to DB at the same time
- B. A view can mainly store data of DB
- C. Isolation: combining program and catalog/metadata together
- Data abstraction provides a conceptual representation of the data to hide certain details of how the data are stored and maintained

- Characteristics of the database approach
- Database users: Actors on the scene
 - Database administrator (DBA)
 - Database designer
 - End user
- Architecture of a DBMS
- Properties of DBMS
- Data models
- **Database** languages

Database administrator

- Many people use the same resources
 - Need a chief administrator to oversee and manage
- Responsibility
 - Administering the DB
 - Authorizing access to the DB
 - Coordinating and monitoring the use of DB
 - Acquiring software and hardware resources as needed

Database administrator

- Many people use the same resources
 - Need a chief administrator to oversee and manage
- Responsibility
 - Administering the DB
 - Authorizing access to the DB
 - Coordinating and monitoring the use of DB
 - Acquiring software and hardware resources as needed

Database designer

- Responsibility
 - Identifying the data to be stored in the DB
 - Choosing appropriate structures to represent and store the DB
 - Communicating with all DB users to understand their requirements, to come up with a design that meet the requirements
- ☐ Can be
 - Staff of the DBA
 - Other staffs taking responsibilities after the DB designed is completed

Database designer

- Responsibility
 - Identifying the data to be stored in the DB
 - Choosing appropriate structures to represent and store the DB
 - Communicating with all DB users to understand their requirements, to come up with a design that meet the requirements
- ☐ Can be
 - Staff of the DBA
 - Other staffs taking responsibilities after the DB designed is completed

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Naïve or parametric end user
 - Sophisticated end user

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Naïve or parametric end user
 - Sophisticated end user

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Occasionally access the DB
 - Need different information each time
 - Use sophisticated DB query language to specify requests
 - Middle or high level manager
 - Naïve or parametric end user
 - Sophisticated end user

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Occasionally access the DB
 - Need different information each time
 - Use sophisticated DB query language to specify requests
 - Middle or high level manager
 - Naïve or parametric end user
 - Sophisticated end user

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Naïve or parametric end user
 - Constantly query and update the DB
 - Use standard types of queries and updates that have been programmed and tested
 - Employee
 - Sophisticated end user

- People whose jobs require to access to the DB
 - Querying, updating, generating reports
- Categories
 - Casual end user
 - Naïve or parametric end user
 - Constantly query and update the DB
 - Use standard types of queries and updates that have been programmed and tested

■ Three-schema architecture:

■ Three-schema architecture:

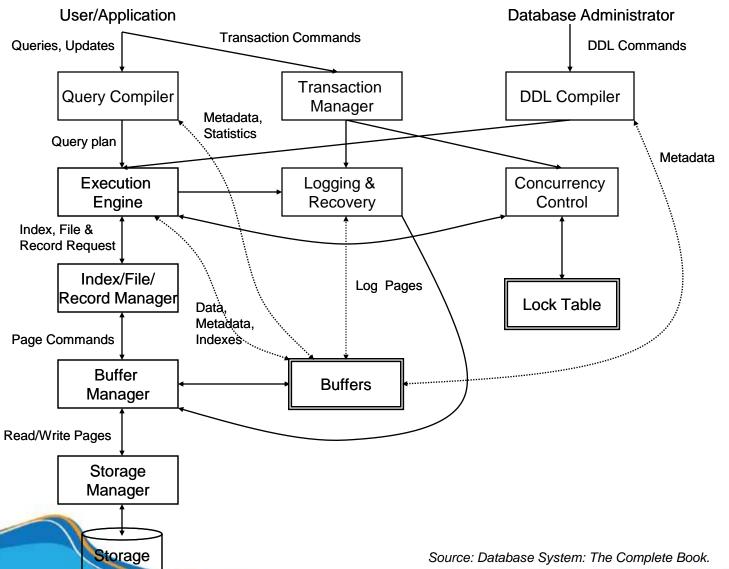

- Data independence
 - Logic data independence
 - The capacity to change the conceptual schema without change to external schemas or application programs
 - Example
 - Adding/removing a record type or data item (expand/reduce DB)
 - Changing constrains
 - Physical data independence
 - The capacity to change the internal schema without change to the conceptual schema
 - Example
 - Physical files had to be reorganized to improve the performance of retrieval or update

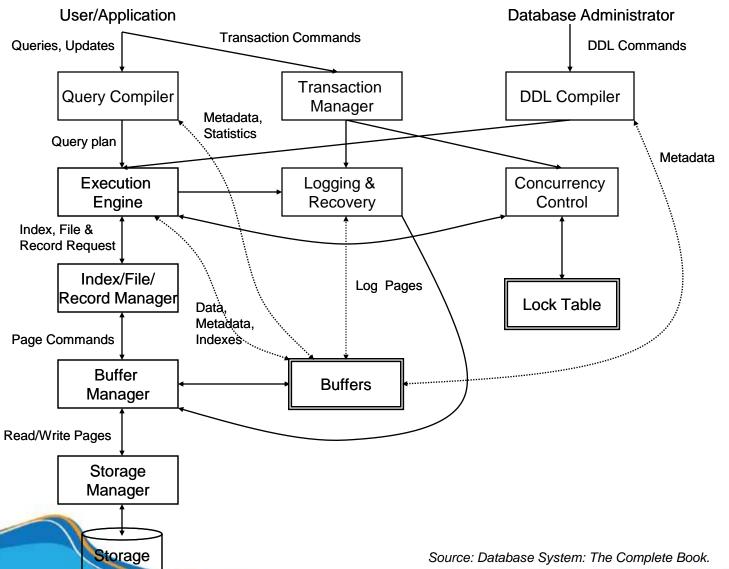

- Data independence
 - Logic data independence
 - The capacity to change the conceptual schema without change to external schemas or application programs
 - Example
 - Adding/removing a record type or data item (expand/reduce DB)
 - Changing constrains
 - Physical data independence
 - The capacity to change the internal schema without change to the conceptual schema

Controlling redundancy By placing all the data together, we do not have to search multiple files to collect this data Data sharing In multiple user environment, concurrency data access is allowed Restricting unauthorized access Users or user groups are given account numbers protected by passwords to gain access to the DB Providing multiple user interfaces Provide query languages for casual users, programming language interfaces for programmers, forms and command codes for parametric users

Controlling redundancy By placing all the data together, we do not have to search multiple files to collect this data Data sharing In multiple user environment, concurrency data access is allowed Restricting unauthorized access Users or user groups are given account numbers protected by passwords to gain access to the DB Providing multiple user interfaces Provide query languages for casual users, programming language interfaces for programmers, forms and command codes for parametric users

- Enforcing integrity constraints
 - Integrity constraints
 - Rules/conditions are derived from the meaning/semantics of the data or the miniworld it represents
 - Some constraints
 - Can be specified to the DBMS and automatically enforced
 - May have to be checked by update programs
- Providing backup and recovery
 - Provide facilities for recovering from hardware and software failures
 - Make sure the DB is restored to the state it was before

- Enforcing integrity constraints
 - Integrity constraints
 - Rules/conditions are derived from the meaning/semantics of the data or the miniworld it represents
 - Some constraints
 - Can be specified to the DBMS and automatically enforced
 - May have to be checked by update programs
- Providing backup and recovery
 - Provide facilities for recovering from hardware and software failures
 - Make sure the DB is restored to the state it was before

- Others
 - Potential for enforcing standards
 - Permit DBA to define and enforce standards among database users in a large organization
 - Flexibility
 - It may be necessary to change the structure of a DB as requirements change without affecting the stored data and the existing application programs
 - Reduced application development time
 - Availability of up-to-date information
 - As soon as one user's update is applied to the DB, all other users can immediately see this update

- Others

- Definition
 - ☐ A collection of *concepts* that can be used to describe the *structure of a DB*
 - Data types, relationships, and constraints
 - Including a set of basic operations for specifying retrievals and updates on the DB
- Categories
 - High level or conceptual data models
 - Representational or implementation data models
 - Low level or physical data models

- Definition
 - ☐ A collection of *concepts* that can be used to describe the *structure of a DB*
 - Data types, relationships, and constraints
 - Including a set of basic operations for specifying retrievals and updates on the DB
- Categories
 - High level or conceptual data models
 - Representational or implementation data models
 - Low level or physical data models

- High level data model
 - Provide concepts that are close to the way users perceive data
 - □ E.g.: entity relationship model, object-oriented model...
- Implementation data model
 - Provide concepts that may be understood by end users, but that are not too far from the way data is organized within the computer
 - □ E.g.: relational model, network and hierarchical models...
- Low level data model
 - Provide concepts the describe the details of how data is stored in the computer

- High level data model
 - Provide concepts that are close to the way users perceive data
 - □ E.g.: entity relationship model, object-oriented model...
- Implementation data model
 - Provide concepts that may be understood by end users, but that are not too far from the way data is organized within the computer
 - □ E.g.: relational model, network and hierarchical models...
- Low level data model
 - Provide concepts the describe the details of how data is stored in the computer

Database schema - Example of ER Model

Database schema

Definition

Description of the structure and constraints on the database about a particular domain (banking, education, marketing, etc.) Example:

SINH VIĒN	TĒNSV	<u>MÄSV</u>	LÓP	NGÅNH
MÔN HỌC	TĒNMH	<u>MÄMH</u>	KHOA	TİNCHİ
ĐIỀU KIỆN	MÄMH TRƯỚC	<u>MÄMH</u>		
			•	
HỌC PHẨN	<u>MÄHP</u>	GIÁOVIĒN	HÓCKĄ	NĀM
KQ_Học	<u>MÄSV</u>	<u>MÄHP</u>	ĐiÊM	

Database schema

Database schema - Example of hierarchical data model

Database schema - Example of hierarchical data model

Database instance or status

Definition

The data stored in database at a particular moment of time is called instance of database.

Content

- Introduction
- The evolution of database systems
- Characteristics of the database approach
- Database users
- Architecture of a DBMS
- Properties of DBMS
- Data models
- Database languages

- DDL Data Definition Language
 - Identify descriptions of the schema constructs
 - Store the schema description in the DBMS catalog
- ☐ SDL Storage Definition Language
 - Specify the internal schema and the mappings between two schemas
- □ VDL − View Definition Language
 - Specify user views and their mapping to the conceptual schema

- DDL Data Definition Language
 - Identify descriptions of the schema constructs
 - Store the schema description in the DBMS catalog
- ☐ SDL Storage Definition Language
 - Specify the internal schema and the mappings between two schemas
- □ VDL − View Definition Language
 - Specify user views and their mapping to the conceptual schema

- DML Data Manipulation Language
 - Provide a set of operations including retrieval, insertion, deletion and modification of the data

- Two types
 - High level (nonprocedural)
 - Entered interactively from a display monitor/terminal, or
 - Embedded in a general-purpose programming language
 - Low level (procedural)
 - Must be embedded in a general-purpose programming language

- DML Data Manipulation Language
